

A ZIRCONIA SINTERED BODY AND A METHOD FOR PRODUCING THE SAME

BACKGROUND OF THE INVENTION

Field of the Invention

5 The present invention relates to a zirconia sintered body having high strength and high toughness, and to a method for producing the same.

Description of Related Art

10 The zirconia sintered body is a kind of ceramics and used for a structural material such as pulverizing media, cutting tools, ferrules used as parts of optical fiber connection, and the like.

 A zirconia powder, which is a raw material of the zirconia
15 sintered body, is obtained by methods; for example, a method comprising steps of precipitating solid substance from an aqueous solution of zirconium compounds and then calcining the solid substance, or a method comprising steps of drying an aqueous solution of zirconium compounds by means of spray
20 drying and then calcining the dried substance (Japanese Patent Application Laid-Open (JP-A) No. 2000-327416). By molding the zirconia powder, and then by sintering the molded green body, a zirconia sintered body is obtained.

 However, conventional zirconia sintered bodies are not
25 enough in viewpoint of strength and toughness. Therefore, more

advanced zirconia sintered body is desired.

SUMMARY OF THE INVENTION

The object of the present invention is to provide a
5 zirconia sintered body having high strength (for example, high
bending strength) and high toughness, and a method for
producing the same.

As a result of extensive investigation on zirconia
sintered bodies, the inventors have been achieved the present
10 invention.

The present invention provide a zirconia sintered body
comprising tetragonal zirconia, wherein a full width at half
maximum at (111) plane of the tetragonal zirconia obtained
by X-ray diffraction pattern measured under following
15 conditions is from 0.38 to 4 degree.

Conditions:

Radiation Source: CuK α beam,
Voltage · Amplitude : 40 kV × 30 mA,
Monochromator: Graphite,
20 Divergence Slit: 1.0 degree,
Scattering Slit: 1.0 degree,
Detector Slit: 0.3 degree,
Step Size: 0.2 degree,
Time/step: continuous,
25 Background Correction: made,

Scan Speed: 0.4 degree/minute.

The present invention also provide a method for producing the zirconia sintered body, wherein the method comprises steps of; molding zirconia powder having an average particle diameter of from 0.1 to 0.6 μm , a maximum particle diameter of 5 μm or less and a substantially polyhedral shape, and then sintering the molded green body under the temperature of from 1200 to 1400 $^{\circ}\text{C}$.

10 BRIEF DESCRIPTION OF THE DRAWINGS

Fig. 1 shows the method to calculate the full width at half maximum.

Fig. 2 shows the X-ray diffraction pattern of the zirconia sintered body obtained in Example 1.

15

DETAILED DESCRIPTION OF THE INVENTION

The zirconia sintered body of the present invention comprising tetragonal zirconia. The full width at half maximum (hereinafter abbreviated to "FWHM") at (111) plane (usually, 2θ = around 30 degree) of the tetragonal zirconia obtained by X-ray diffraction pattern is 0.38 degree or more, preferably 0.4 degree or more, further preferably 0.41 degree or more, and 4 degree or less, preferably 2 degree or less, further preferably 1 degree or less.

25 The X-ray diffraction pattern is measured under

following conditions;

Radiation Source: CuK α beam,
Voltage · Amplitude : 40 kV × 30 mA,
Monochromator: Graphite ,
5 Divergence Slit: 1.0 degree,
Scattering Slit: 1.0 degree,
Detector Slit: 0.3 degree,
Step Size: 0.2 degree,
Time/step: continuous,
10 Background Correction: made,
Scan Speed: 0.4 degree/minute.

It is preferable for the zirconia sintered body of the present invention that a ratio of tetragonal crystal in the zirconia sintered body is as high as possible. For example,
15 the ratio is preferably 90 % by volume or more. The ratio of tetragonal crystal is calculated from the X-ray diffraction peak intensity at (111) plane of tetragonal crystal lattice, and the intensities at (111) plane of monoclinic crystal lattice and at (11-1) plane of monoclinic crystal lattice.

20 The zirconia sintered body of the present invention is usually polycrystalline and usually has an average grain size of about 0.01 μm or more, preferably about 0.05 μm or more, and about 0.3 μm or less, preferably about 0.2 μm or less.

The zirconia sintered body of the present invention may
25 contain a stabilizer. The stabilizer may be one that can make

the tetragonal zirconia metastable at room temperature(for example, at 20 °C); such as Y_2O_3 , CeO_2 , MgO , CaO , TiO_2 , Yb_2O_3 , Er_2O_3 , Ho_2O_3 , and the like. An amount of the stabilizer in a sintered body is usually about 2 % by weight or more and
5 about 10% by weight or less. The zirconia sintered body of the present invention may contain Al_2O_3 . An amount of Al_2O_3 , if contained, is usually about 0.1 % by weight or more and about 0.5% by weight or less. A density of the zirconia sintered body of the present invention is preferably 6 g/cm³ or more.
10 The upper limit of density is theoretical density, that is, 6.1 g/cm³.

The zirconia sintered body of the present invention may be produced by a method comprising steps of, for example, molding zirconia powder and then sintering the molded green
15 body.

A zirconia powder, which is a raw material of the zirconia sintered body of the present invention, is a compound represented by formula ZrO_2 . An average particle diameter of the zirconia powder is about 0.1 μm or more and about 0.6 μm
20 or less, and a maximum particle diameter is about 5 μm or less. The zirconia powder has substantially polyhedral shape. Furthermore, a ratio of monoclinic crystal in the zirconia powder is usually about 70 % by volume or more, preferably about 80 % by volume or more, further preferably about 90%
25 by volume or more. BET specific surface area of the zirconia

powder is about 10 m²/g or more, preferably about 15 m²/g or more, and about 30 m²/g or less, preferably about 20 m²/g or less.

The zirconia powder may contain above-mentioned
5 stabilizer. An amount of the stabilizer in a sintered body is usually about 2 % by weight or more and about 10 % by weight or less per weight of finally to-be-obtained zirconia sintered body. The stabilizer may be, besides a metal oxide such as Y₂O₃, CeO₂, MgO, CaO, TiO₂, Yb₂O₃, Er₂O₃, Ho₂O₃, and the like,
10 metal compounds which are convertible to such metal oxides during a sintering step mentioned hereinafter (as example of the metal compounds, metal hydroxide, metal chloride, metal nitrate, metal sulfate are indicated.).

The zirconia powder may be mixed with a sintering agent.
15 The sintering agent includes aluminum oxide such as Al₂O₃, and aluminum compounds which are transformable to such aluminum oxide during a sintering step mentioned hereinafter (as example of the aluminum compounds, aluminum hydroxide, aluminum chloride, aluminum nitrate, aluminum
20 sulfate are indicated.). The amount of sintering agent is usually about 0.1 % by weight or more and about 10 % by weight or less per weight of finally to-be-obtained zirconia sintered body.

Above mentioned zirconia powder, of which the average
25 particle diameter and the maximum particle diameter

respectively belong to above-described ranges and the powder shape is substantially polyhedral, may be produced by a method comprising steps of, for example, pre-calcining zirconium oxychloride under the air at the temperature of 200 °C or more
5 and less than 700 °C, mixing appropriate stabilizer and sintering agent with the powder obtained by pre-calcining, and the calcining the mixture under a gas containing hydrogen chloride at the temperature of 700 °C or more and 1100 °C or less, and then pulverizing the calcined mixture.

10 The zirconia powder, which is a raw material of zirconia sintered body of the present invention, is usually granulated. Granulating may be achieved by using spray dryer, and the like. Specifically, the zirconia powder is mixed with water to form slurry, and the formed slurry is dried by spray drying at inlet
15 temperature of 210-230°C, outlet temperature of 100-130°C and in case of using a disk type spray dryer, at disk rotating speed of 5000-15000 rpm.

 The zirconia powder or granule is molded. The molding may be achieved by known methods; for example, pressing (cold
20 isostatic pressing, and the like), slip casting, tape casting, extruding or injecting. For molding, if necessary, a binder (an organic binder such as polyvinyl alcohol (PVA), and the like) is added to the zirconia powder. The green body obtained by molding the zirconia powder, if necessary, is heated at the
25 temperature of 400 °C or more and 800 °C or less. By heating,

the binder in the green body can be removed.

The green body obtained by molding the zirconia powder is sintered. The sintering temperature is usually about 1200 °C or more and 1400 °C or less. When the sintering temperature is lower, the density of the zirconia sintered body decreases. On the other hand, when the sintering temperature is higher, the average grain size becomes larger and a zirconia sintered body having high strength and high toughness cannot be obtained. The sintering period is usually about 1 hour or more, within about 24 hours. The sintering may be achieved under oxidizing gas such as air, oxygen; inert gas such as nitrogen, argon or helium; reducing gas such as hydrogen ;or mixture of oxidizing gas and inert gas, preferably under oxidizing gas, inert gas or mixture thereof. The total pressure of gas at sintering is atmospheric pressure (about 800 hPa or more and about 1200 hPa or less).

The zirconia sintered body of the present invention has high strength and high toughness. The zirconia sintered body of the present invention is also superior in water resistance. The zirconia sintered body is suitable to a structural material such as pulverizing media, cutting tools, ferrules used as parts of optical fiber connection, and the like.

Example

The invention will now be described by the following

examples. However, the present invention is not limited to those examples. The properties of zirconia powder and of zirconia sintered body were measured by following methods.

5 The shape of primary particle:

It was measured by using a scanning electron microscope (trade name "T-300", manufactured by JEOL. Ltd.) and a transmission electron microscope (trade name "TEMH9000NAR", manufactured by Hitachi, Ltd.).

10

The average particle diameter D50 (μm), and the maximum particle diameter D100 (μm):

By using a particle size distribution analyzer (trade name "SALD2000A", manufactured by Shimadzu Corporation),
15 a particle size distribution curve was drawn by plotting the accumulated weight of particles as ordinate and the particle size as abscissa. The particle size at which the accumulated weight becomes 50 % by weight is named as D50, and the particle size at which the accumulated
20 weight becomes 100 % by weight is named as D100. About accumulated weight, the accumulated weight on ordinate of the particle size distribution curve is the value accumulating the weight of particles according to their size difference from smaller to larger.

25

BET specific surface area (m^2/g):

It was measured by using a specific surface area analyzer (trade name "FLOWSORP 2300II", manufactured by Shimadzu Corporation).

5

Fracture toughness ($\text{MPa}\cdot\text{m}^{1/2}$):

It was measured according to the industrial standard JIS-R-1601 by using Vickers hardness testing machine (trade name "AVK-C2", manufactured by Akashi Corporation).

10

Three-point bending strength:

It was measured according to JIS-R-1601.

15 Average grain size (μm):

It was, by taking photograph of sintered body by using a scanning electron microscope, determined by a section method (linear intercept method).

20 Crystal phase, and FWHM at (111) plane of tetragonal zirconia:

X-ray diffraction pattern was measured under the following conditions by using a X-ray diffractometer (trade name "RINT2500TTR", manufactured by Rigaku Corporation).

25

Conditions:

Radiation Source: CuK α beam,
 Voltage · Amplitude : 40 kV × 30 mA,
 Monochromator: Graphite ,
 Divergence Slit: 1.0 degree,
 5 Scattering Slit: 1.0 degree,
 Detector Slit: 0.3 degree,
 Step Size: 0.2 degree,
 Time/step: continuous,
 Background Correction: made,
 10 Scan Speed: 0.4 degree/minute.

Then, ratios of tetragonal crystal and of monoclinic
 crystal were calculated according to following
 equations;

15 The ratio of tetragonal crystal (% by volume)

$$\begin{aligned}
 & \text{It}(111) \\
 & = \frac{\text{It}(111)}{\text{Im}(111) + \text{Im}(11-1) + \text{It}(111)} \times 100
 \end{aligned}$$

20

The ratio of monoclinic crystal (% by volume)

$$\begin{aligned}
 & \text{Im}(111) + \text{Im}(11-1) \\
 & = \frac{\text{Im}(111) + \text{Im}(11-1)}{\text{Im}(111) + \text{Im}(11-1) + \text{It}(111)} \times 100
 \end{aligned}$$

25

where;

It(111): peak intensity at (111) plane of tetragonal
 zirconia,

Im(111): peak intensity at (111) plane of monoclinic zirconia,

Im(11-1): peak intensity at (11-1) plane of monoclinic zirconia.

5 And, from the X-ray diffraction pattern, as shown in Fig.1, FWHM at (111) plane of tetragonal zirconia was measured.

EXAMPLE 1

[Preparation of zirconia powder]

10 Zirconium oxychloride (manufactured by Wako Pure Chemical Industries, Ltd., Special grade chemical) was pre-calcined under the air at 600 °C for 3 hours. With 94.5 parts by weight of pre-calcined substance, 5.25 parts by weight of yttrium oxide (Y_2O_3 , Average particle diameter: 0.4 μm ,
15 manufactured by Nippon Yttrium Co., Ltd.) and 0.25 parts by weight of alumina (trade name "AKP-30", manufactured by Sumitomo Chemical Co., Ltd.) were mixed, and the mixture was mixed for 6 hours by using ball mill. The mixture, under a gas (hydrogen chloride of 30 % by volume, air of 70 % by volume),
20 was calcined at 1080 °C for 1 hour. Calcined powder was pulverized in a wet process by using ball mill, and then zirconia powder was obtained. The zirconia powder had polyhedral shape. The properties of the zirconia powder are shown in table 1.

25 [Production and evaluation of zirconia sintered body]

With 60 parts by weight of the zirconia powder, 40 parts by weight of water, and 1 part by weight of dispersant (trade name "SN5468", manufactured by Sannopco Ltd.) were mixed to form slurry. Then this slurry is granulated by using spray
5 dryer (trade name "AN-40CR", manufactured by Ashizawa-Niro) under the conditions of inlet temperature of 220°C, outlet temperature of 110°C and disk rotating speed of 10000 rpm, and then the granule having average particle diameter of 65 µm was obtained. The granule was molded by cold isostatic
10 pressing (CIP) under the conditions of molding pressure of 1.5 t/cm² and of charged time of 180 seconds, and then molded green body was sintered under the air at 1350 °C for 3 hours. The properties of obtained zirconia sintered body are shown in Table 2.

15

EXAMPLE 2

The zirconia powder was obtained in the same manner as in Example 1 except that alumina was not added in the procedure of [Preparation of zirconia powder] in Example 1. With the
20 zirconia powder, a zirconia sintered body was produced in the same manner of [Producing and evaluating zirconia sintered body] in Example 1. The properties of the zirconia powder are shown in Table 1 and that of the zirconia sintered body are shown in Table 2.

25

EXAMPLE 3

The zirconia powder was obtained in the same manner as in Example 1 except that calcination temperature was changed to 1000 °C in the procedure of [Preparation of zirconia powder] in Example 1. With the zirconia powder, a zirconia sintered body was produced in the same manner of [Production and evaluation of zirconia sintered body] in Example 1. The properties of the zirconia powder are shown in Table 1 and that of the zirconia sintered body are shown in Table 2.

COMPARATIVE EXAMPLE 1

30 % by weight aqueous solution of zirconium oxychloride (manufactured by Wako Pure Chemical Industries, Ltd., Special grade chemical) was heated at 80 °C for 30 hours to precipitate zirconium hydrate, and then the precipitated was filtrated. The precipitated was dried at 110 °C for 3 hours to obtain dried zirconium hydrate. With 94.5 parts by weight of this dried zirconium hydrate, 5.25 parts by weight of yttrium oxide (Y_2O_3 , Average particle diameter: 0.4 μm , manufactured by Nippon Yttrium Co., Ltd.) and 0.25 parts by weight of alumina (trade name "AKP-30", manufactured by Sumitomo Chemical Co., Ltd.) were mixed, and the mixture was mixed for 6 hours by using ball mill. The mixture was calcined under the air at 1070 °C for 3 hours. Calcined powder was pulverized in a wet process by using ball mill, and then zirconia powder was

obtained. The zirconia powder was not uniform and had no polyhedral shape.

With the zirconia powder, a zirconia sintered body was produced in the same manner of [Production and evaluation of zirconia
5 sintered body] in Example 1. The properties of the zirconia powder are shown in Table 1 and that of the zirconia sintered body are shown in Table 2.

COMPARATIVE EXAMPLE 2

10 30 % by weight aqueous solution of zirconium oxychloride (manufactured by Wako Pure Chemical Industries, Ltd., Special grade chemical) and 10 % by weight aqueous ammonia, which is two-time equivalent to the aqueous solution of zirconium oxychloride, were mixed to precipitate zirconium hydrate, and
15 then the precipitate was filtrated. The precipitated was dried at 110 °C for 3 hours to obtain dried zirconium hydrate. With 94.5 parts by weight of this dried zirconium hydrate, 5.25 parts by weight of yttrium oxide (Y_2O_3 , Average particle diameter: 0.4 μm , manufactured by Nippon Yttrium Co., Ltd.)
20 and 0.25 parts by weight of alumina (trade name "AKP-30", manufactured by Sumitomo Chemical Co., Ltd.) were mixed, and the mixture was mixed for 6 hours by using ball mill. This mixture was calcined under the air at 1070 °C for 3 hours. The calcined powder was pulverized in a wet process by using
25 ball mill, and then zirconia powder was obtained. The zirconia

powder was not uniform and had no polyhedral shape.

With the zirconia powder, a zirconia sintered body was produced in the same manner of [Production and evaluation of zirconia sintered body] in Example 1. The properties of the zirconia powder are shown in Table 1 and that of the zirconia sintered body are shown in Table 2.

Table 1 The properties of zirconia powder
